BloodCode Crypto Payment Safety Checklist

Price target: 29-79 EUR

Rule

Screenshots are not payment proof. Explorer confirmation is proof.

Before Receiving Payment

- Agree the token.
- Agree the network.
- Send the exact address.
- Confirm the correct contract if token-based.
- Use a small test transaction first.

Verification

- Open the trusted explorer manually.
- Check sender and receiver.
- Check amount.
- Check token contract.
- Check network.
- Check confirmation status.
- Check that the balance is final and spendable.

Red Flags

- pressure to release early,
- screenshot only,
- unknown token with familiar name,
- wrong network,
- fake support message,
- temporary balance claim,
- transaction ID that does not match explorer data.

P2P Rule

Do not release product, funds, account, or goods until verification is complete.

Internal Note

If unsure, pause. A delayed transaction is cheaper than a wrong release.
